

DETAILED **TECHNICAL** EGRYATION:

LLENTAB STEEL BUILDINGS

LLENTAB steel constructions are designed from elements made from cold-bent profiles that are screwed together. The profiles are manufactured by means of continuous rolling or bending on press brakes. The elements are made of hot-dip zinc coated steel coils of high-strength steel. The individual pieces are joined with class 8.8 screws (most often M12 or M16).

LLENTAB manufactures all profiles from high-strength steel. Profiles with a material thickness of 1.5 to 7 mm are made from hot-dip zinc coated steel coils. Cold-rolled hot-dip zinc coated profiles guarantee long-term quality and low steel consumption. Profiles with material thickness up to 2 mm are protected by a layer of Z275 zinc [275 g/m²]. From the thickness of 2.5 mm onwards, Z450 zinc coating [450 g/m²] is used as standard.

The basic shapes of LLENTAB profiles are as follows: **Z-profiles** (for roof purlins and wall purlins), **C-profiles** (for columns, trusses, frame parts), **H-profiles** (for upper and lower chords of truss structures). Mounting holes are pre-formed in all profiles during production.

The structures are designed as frames with a truss bar determining the shape of the roof. The columns are designed as segmented elements with frame connectors or as truss columns. The truss girders are assembled from C-profiles and H-profiles. From the structural perspective, the frames are designed as double-hinged or fixed, or as hinged roof trusses on columns that are fixed (screwed or welded) or restrained in foundation.

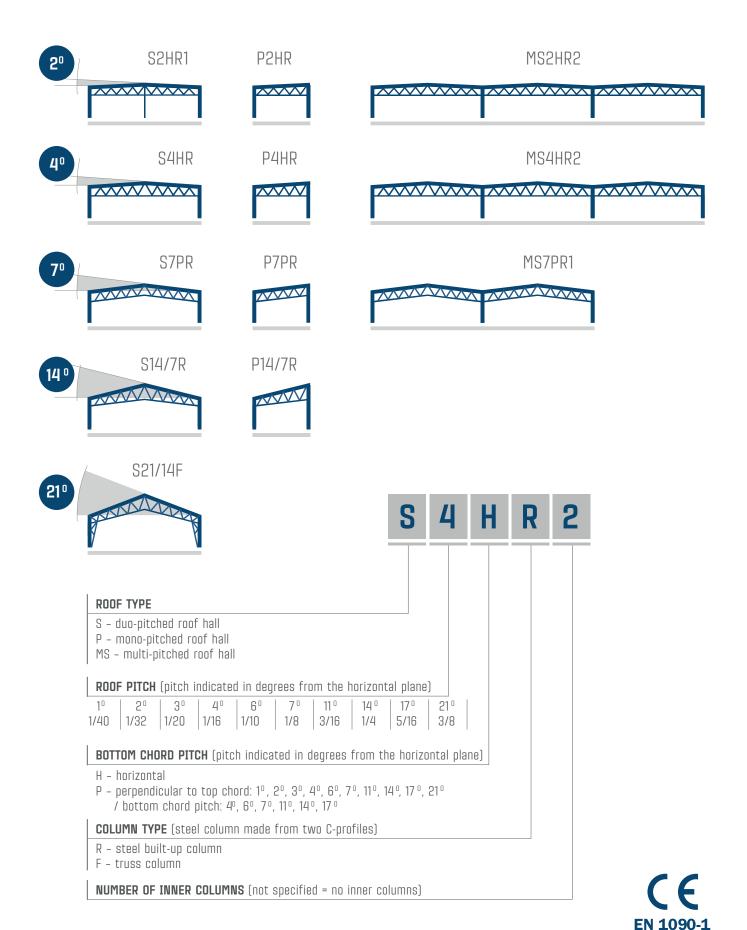

All structures are designed to satisfy specific client requirements (dimensions, cladding, loading, windows, doors, gates, etc.). LLENTAB uses a modular system of floor plan dimensions with a span of 300 mm. This span affects the follow-up secondary structures, accessories and standard details. We are open to tailor-made client requirements and designs.

The optimal layout of the frames and the design of the hall structure take into account loading, cladding types and specific hall structure requirements if any. **LLENTAB's technical** department we will be happy to prepare basic construction drawings for you free of charge which may be used for the preparation of project documentation.

HALL TYPES

COLUMNS - STANDARD

2xC COLUMN

Column for standard load.

Battened cross-section made of two C-profiles

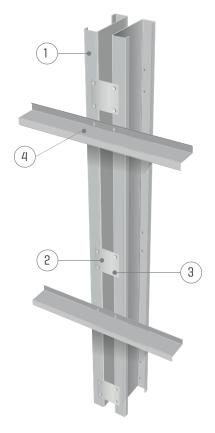

LLENTAB steel

QUADRO (4xC)

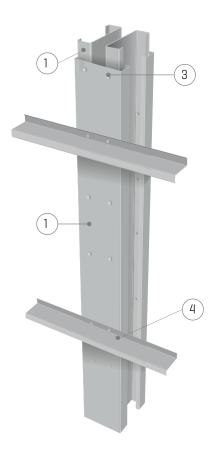

Reinforced column for heavy load and high hall. Closed assembly made of four separate C-profiles LLENTAB steel

TRUSS

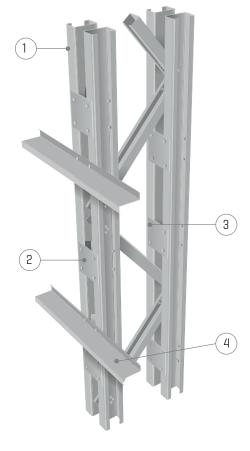

Reinforced column for very high hall. 2x2 C-profiles and diagonals (C-profiles) LLENTAB steel

2xC170: thickness 3/4/5/6 mm 2xC250: thickness 3/4/5/6 mm 2xC300: thickness 5/6 mm 2xC360: thickness 4/5/6 mm 2xC380: thickness 6 mm

4xC360: thickness 4/5/6 mm

4xC170: thickness 3/4/5/6 mm 4xC250: thickness 3/4/5/6 mm (+combination 170 mm a 250 mm)

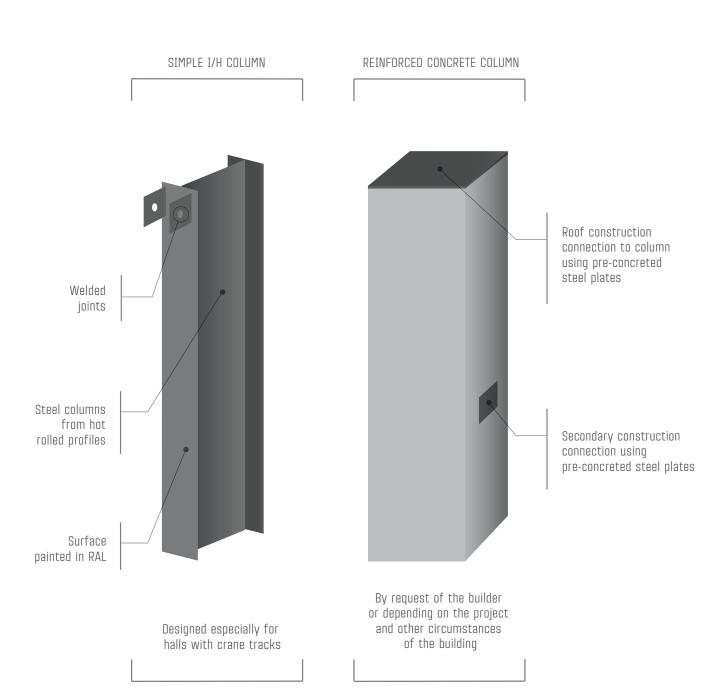

- 1 C-profile, hot-dip zinc coating (450 g/m²), pre-formed holes
- 2 Steel batten, hot-dip zinc coating (450 g/m²), pre-formed holes
- Galvanized, mounting screw class 8.8 with pad and nut
- Wall purlin,
 hot-dip zinc coating (275g/m² or 450 g/m²),
 Z-profile

COLUMN - VARIANTS

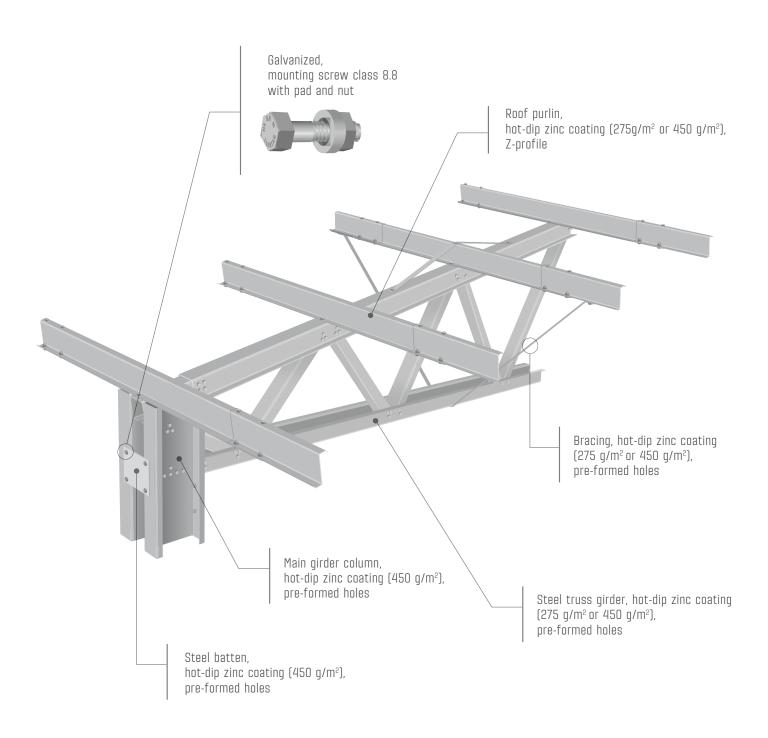

TRUSS GIRDER

Trusses are the primary supporting structure of the hall roof. The truss elements form the upper and lower chord, which are connected by diagonals. The pitch chords are most often made of "omega" shaped profiles or a pair of C-profiles. The diagonals are from one C-profile. The chords can be of different pitch. The pitch of the upper chord determines the resulting pitch of the roof.

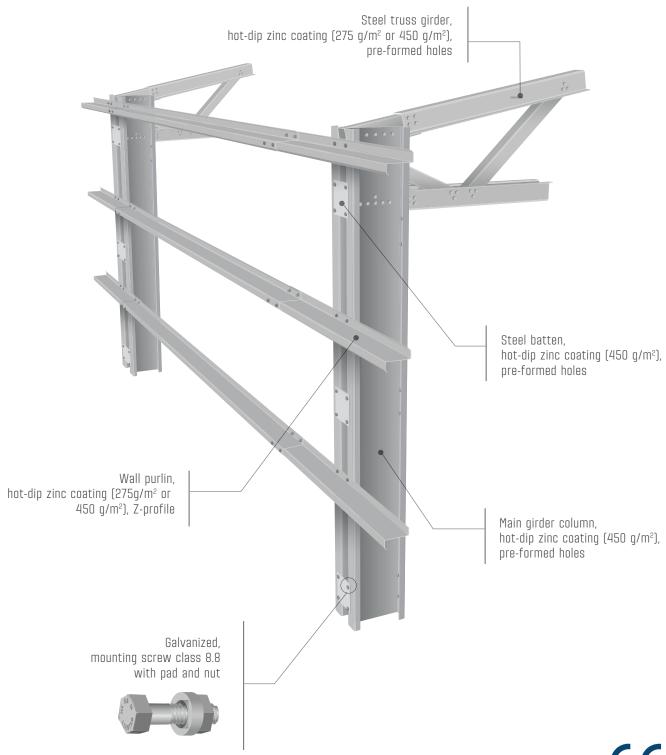

WALL PURLINS

Wall purlins are a secondary supporting structure of the hall wall anchored to the columns. They are horizontal beams that transfer the horizontal wind load from the wall cladding of panels or plates. Wall purlins are usually designed as joined beams. The load from the actual weight of the cladding is transferred to the foundation or plinth sill. Wall purlins are most often made from Z- or C-profiles.

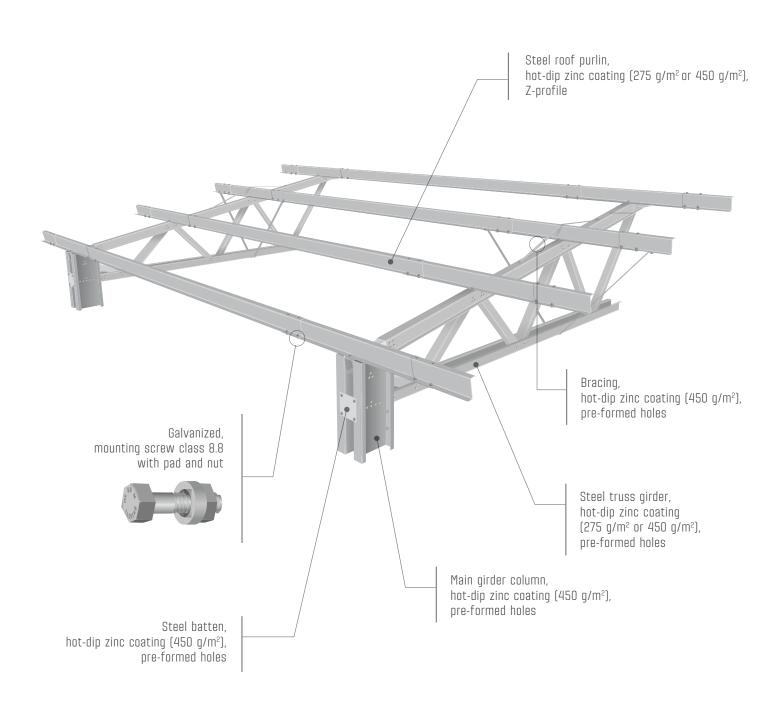

ROOF PURLINS

Roof purlins are a secondary supporting structure of the hall roof anchored to the trusses. These profiles carry the vertical wind load from the roof cladding. Roof purlins are usually designed as continuous beams and are also part of the roof reinforcement and stabilize the upper girder chord against buckling. Z-profiles are most often used for the roof purlins.

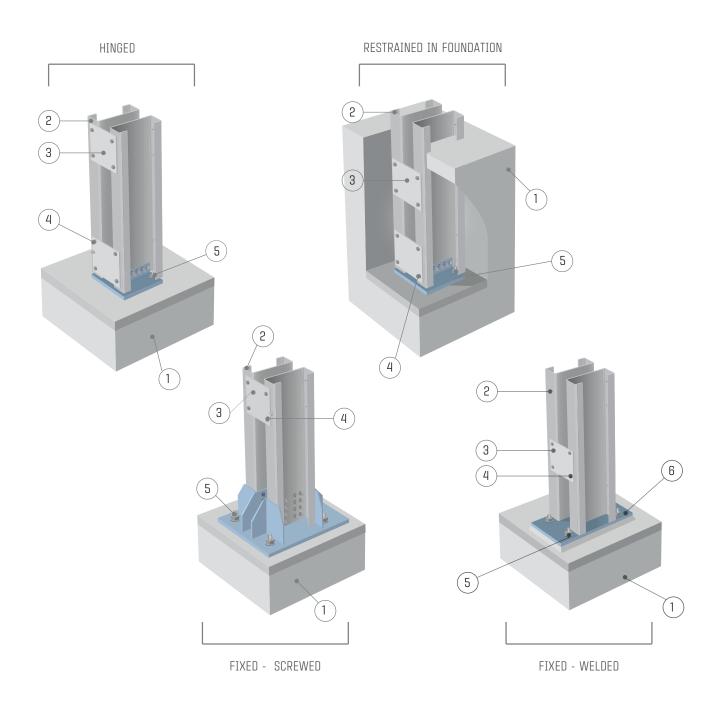

COLUMNS - FOUNDATION CONNECTION

- Footing
- Main girder column, with hot-dip zinc coating (450 g/m2), pre-formed holes
- 4 Galvanized, mounting screw class 8.8 with pad and nut
- (5) Injectable anchors or cast-in anchors
- (3) Batten 6 Foot plate welded to the column

COLUMN - TRUSS GIRDER connection

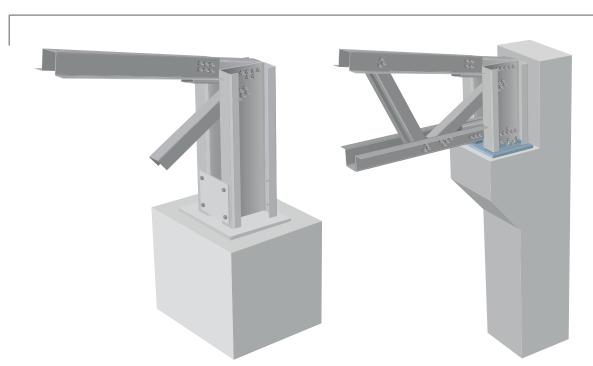

RIGID CONNECTION TO STEEL COLUMN

HINGED CONNECTION TO STEEL COLUMN

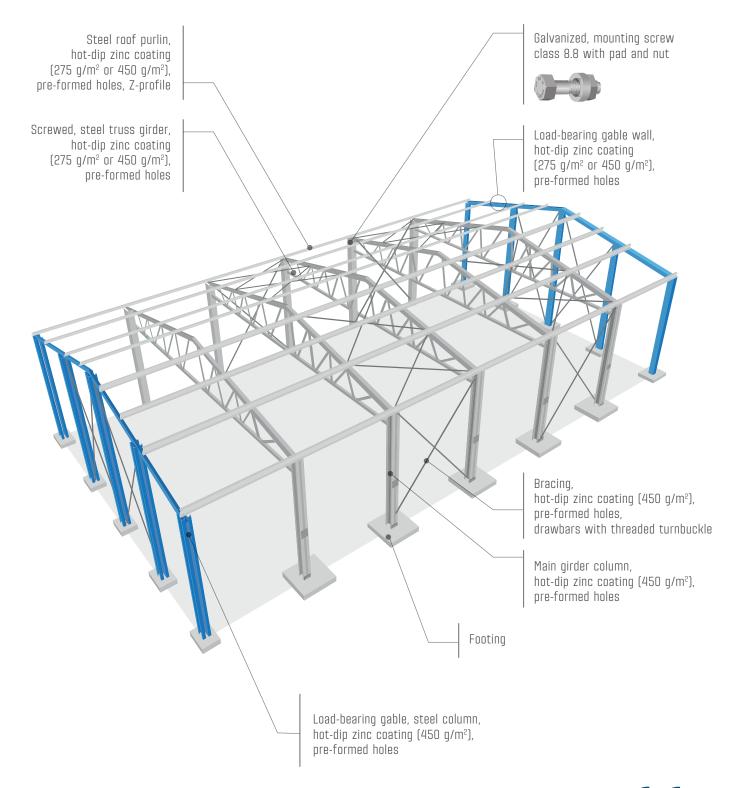

HINGED CONNECTION TO REINFORCED CONCRETE COLUMN

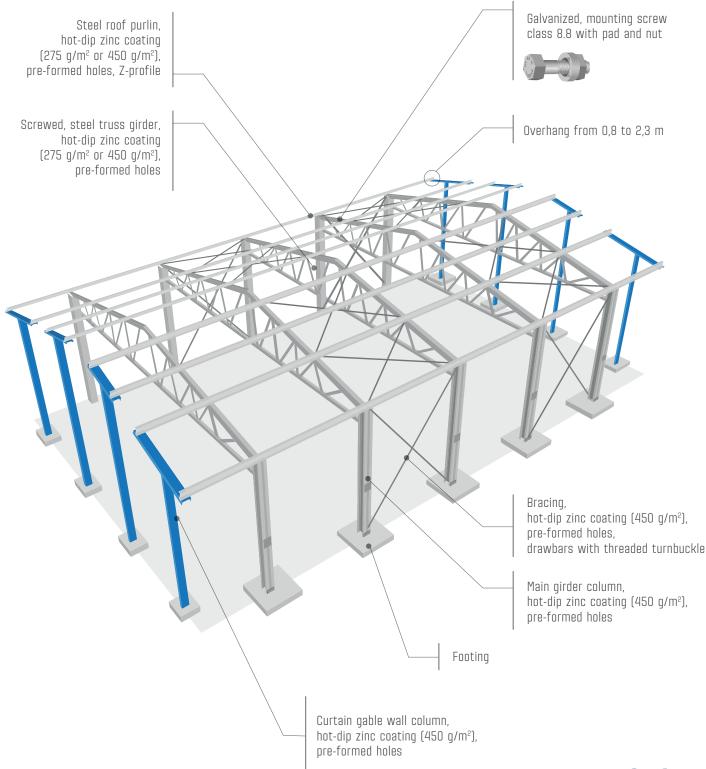

CONSTRUCTION with load-bearing gable wall

CONSTRUCTION with standard gable wall (overhang)

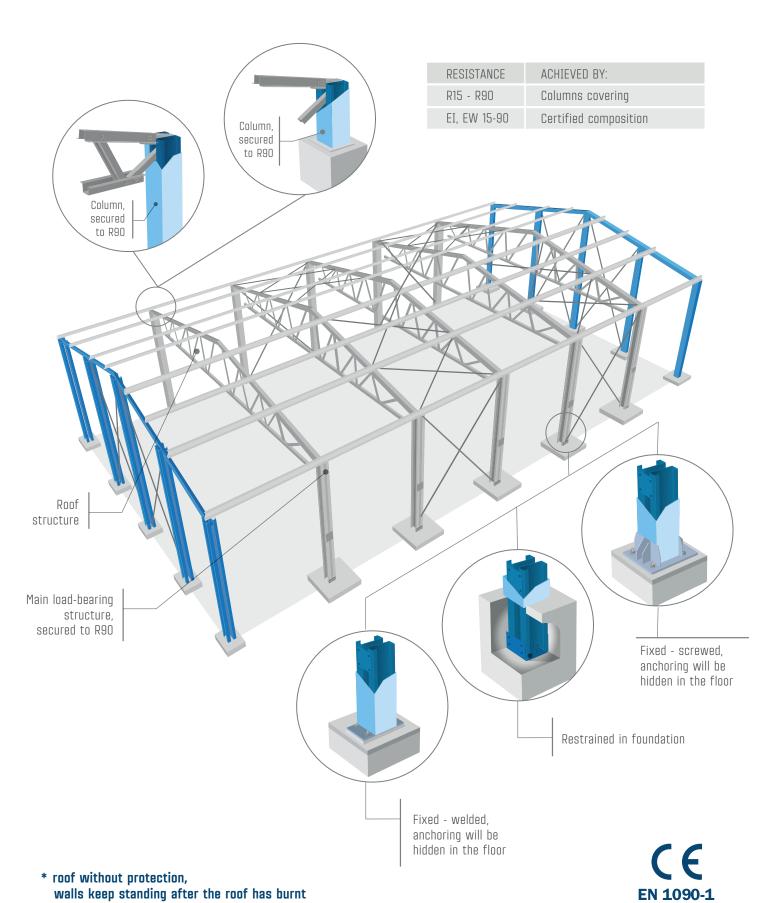

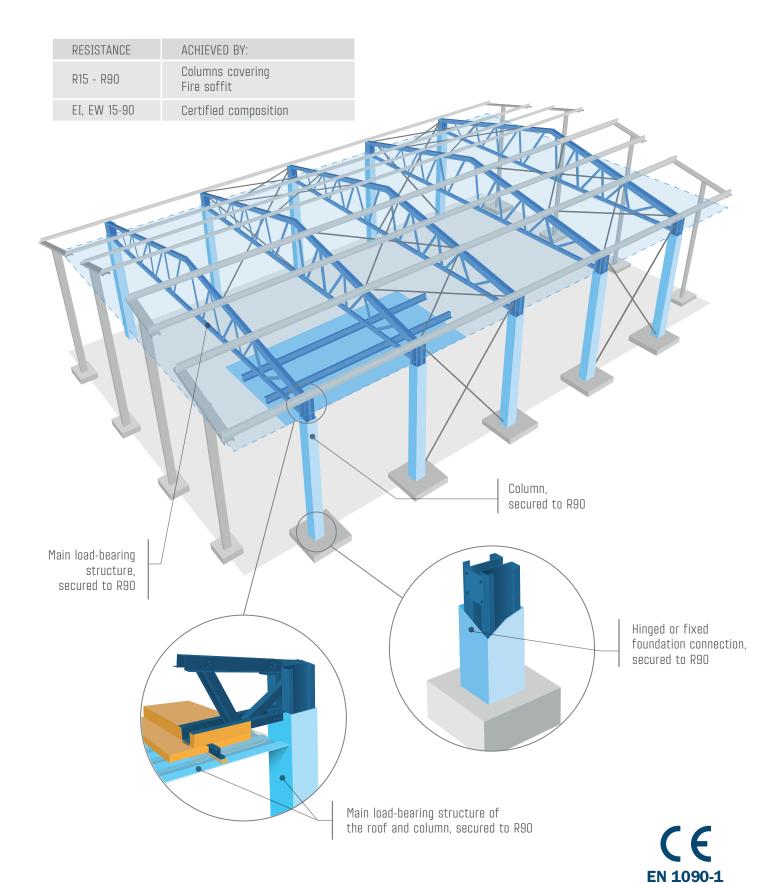

FIRE RESISTANCE walls - construction protection*

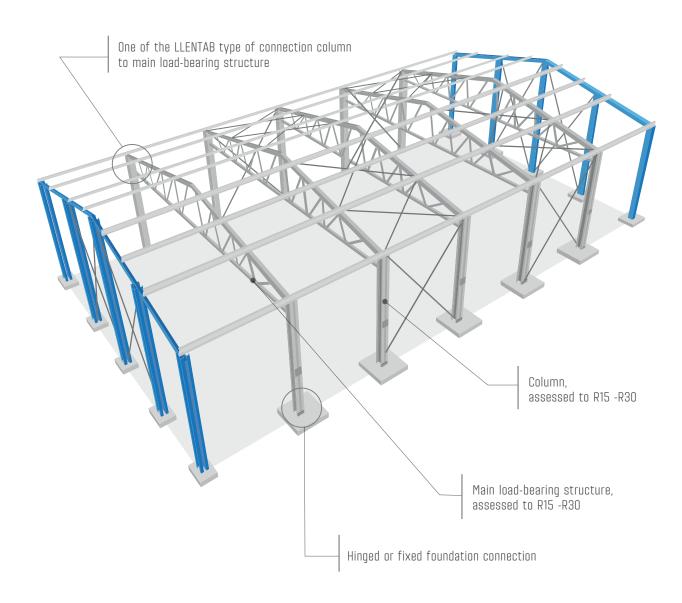

FIRE RESISTANCE walls/roof - calculated according to Eurocode

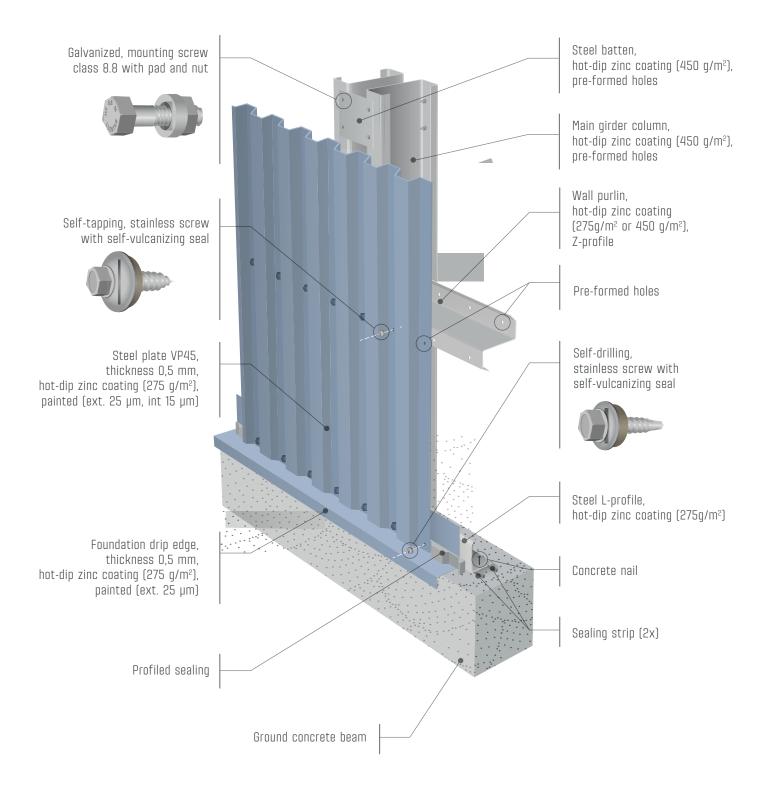

RESISTANCE	ACHIEVED BY:
R15	Calculated according to the standard curve or in the case of fitting sprinklers or smoke extraction, an expert opinion being made
R30	In the case of sprinklers or smoke extraction, carry out an expert opinion
EI, EW 15-30	Certified composition

WALL - TYPE O Uninsulated

BUILDING SIZE

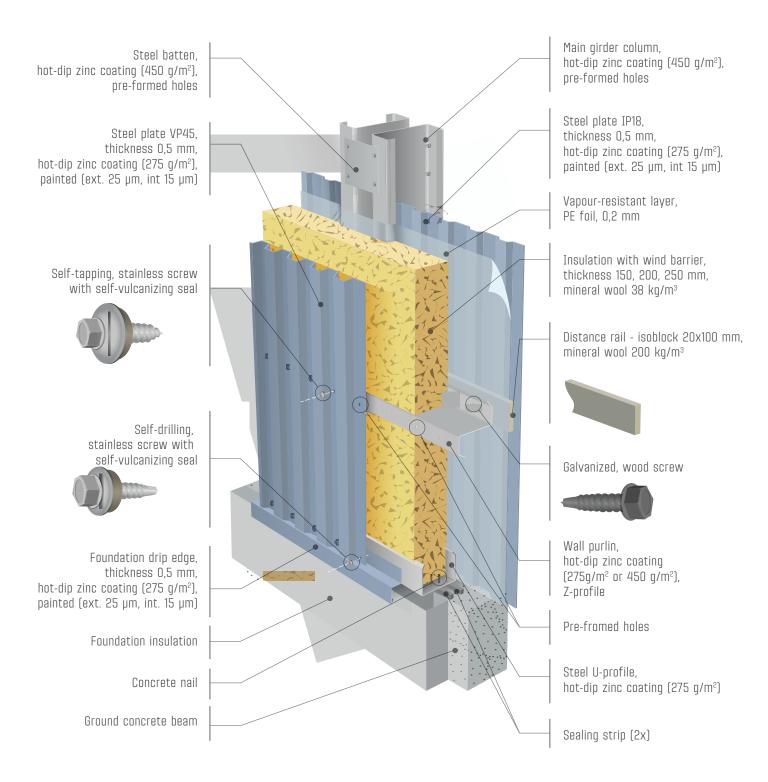

INSULATION

ROOF SLOPE

WALL - TYPE 4F wall insulation - compound cladding

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACCO 14°C (U _n = 0,32)	Drding to Intern 16°C (U _n = 0,27)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,20)
150	U = 0,30	compliant	-	-
200	U = 0,23	compliant	compliant	-
250	U = 0,18	compliant	compliant	compliant

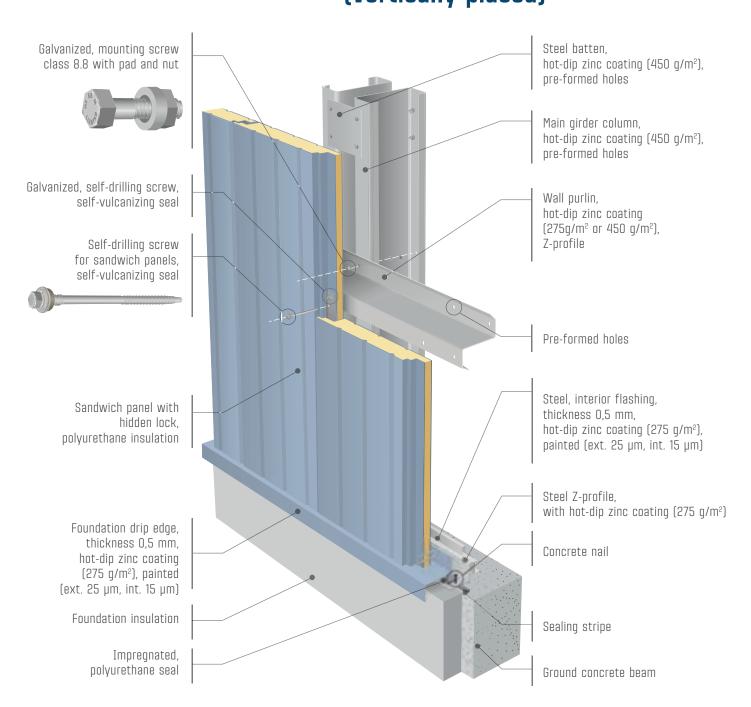

WALL - TYPE 6 wall insulation - PUR sandwich panels (vertically placed)

PANEL VALUES - IPN/PUR FILLING

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACC 14°C (U _n = 0,32)	CORDING TO INTERN 16°C (U _n = 0,27)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,20)
100	U = 0,22	compliant	compliant	-
120	U = 0,19	compliant	compliant	compliant
150	U = 0,15	compliant	compliant	compliant
200	U = 0,11	compliant	compliant	compliant

Note: Filling - IPN λ = 0,024W/(m.K), ρ = 37 kg/m³.

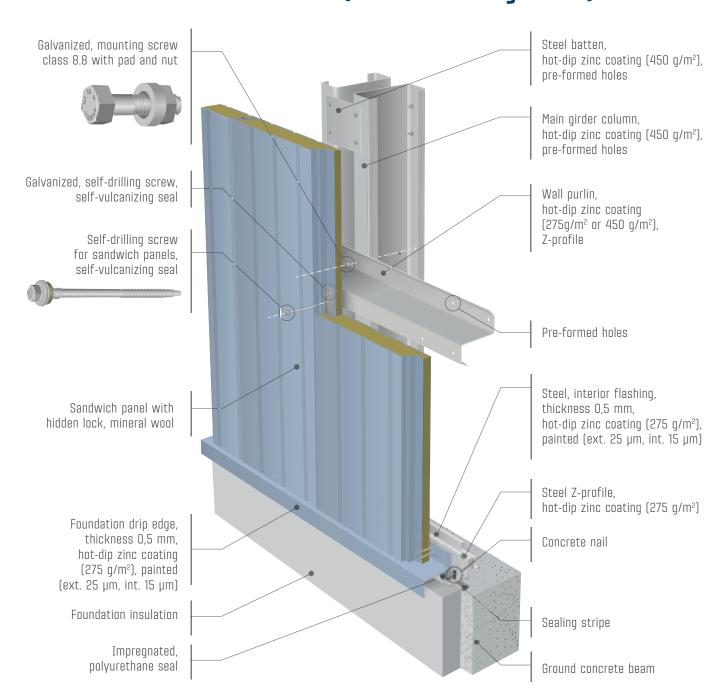

wall insulation - mineral wool sandwich panels (vertical arrangement)

LLENTAB PANEL VALUES - MINERAL WOOL FILLING

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACC 14°C (U _n = 0,32)	ording to interna 16°C (U _n = 0,27)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,20)
120	U = 0,32	compliant	-	-
150	U = 0,27	compliant	compliant	-
240	U = 0,18	compliant	compliant	compliant

lote: System thermal bridges were taken into account when calculating thermal transmittance. Filling - mineral wool λ = 0,040W/mK, ρ = 85 kg/m³. Panels from other manufacturers can also be used with other fillings, e.g. PUR.

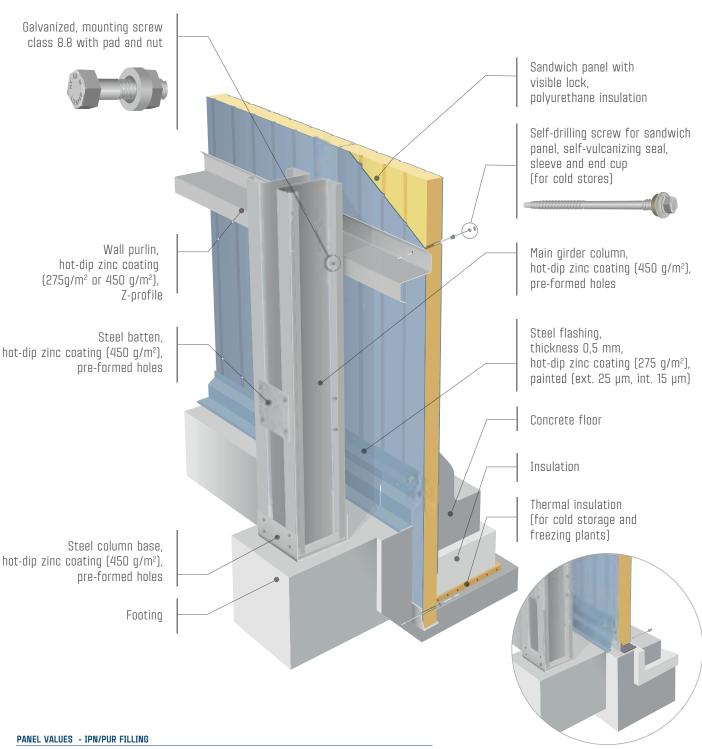

WALL - TYPE 6W

wall insulation - PUR sandwich panels (inner vertical arrangement)

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACC 14°C (U _n = 0,32)	ORDING TO INTERNA 16°C (U _n = 0,27)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,20)
100	U = 0,22	compliant	compliant	-
120	U = 0,19	compliant	compliant	compliant
150	U = 0,15	compliant	compliant	compliant
200	U = 0,11	compliant	compliant	compliant

Note: Filling - IPN λ = 0,024W/(m.K), ρ = 37 kg/m³.

Alternative solution

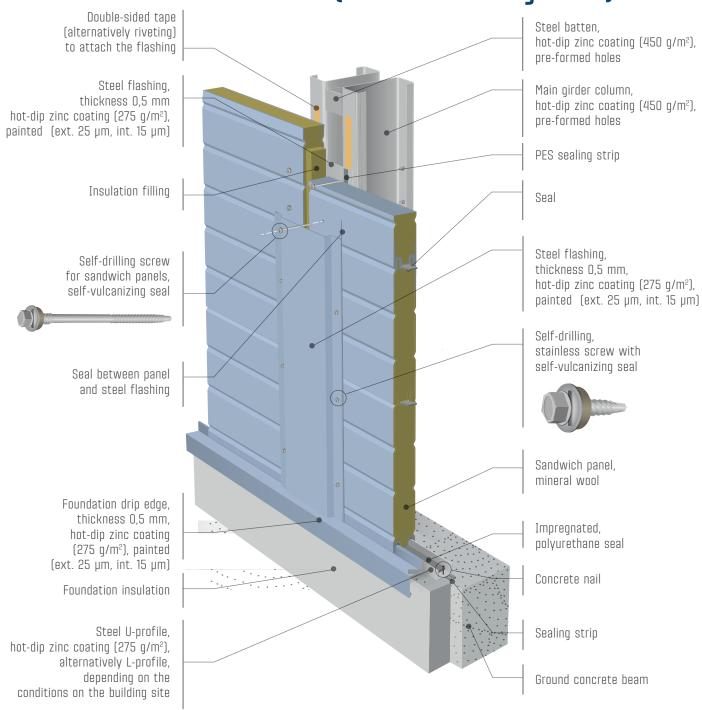

wall insulation - mineral wool sandwich panels (horizontal arrangement)

LLENTAB PANEL VALUES - MINERAL WOOL FILLING

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACC 14°C (U _n = 0,32)	ording to interna 16°C (U _n = 0,27)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,20)
120	U = 0,32	compliant	-	-
150	U = 0,27	compliant	compliant	-
240	U = 0,18	compliant	compliant	compliant

nte: System thermal bridges were taken into account when calculating thermal transmittance. Filling- mineral wool λ = 0,040W/mK, ρ = 85 kg/m³. Panels from other manufacturers can also be used with other fillings, e.g. PUR.

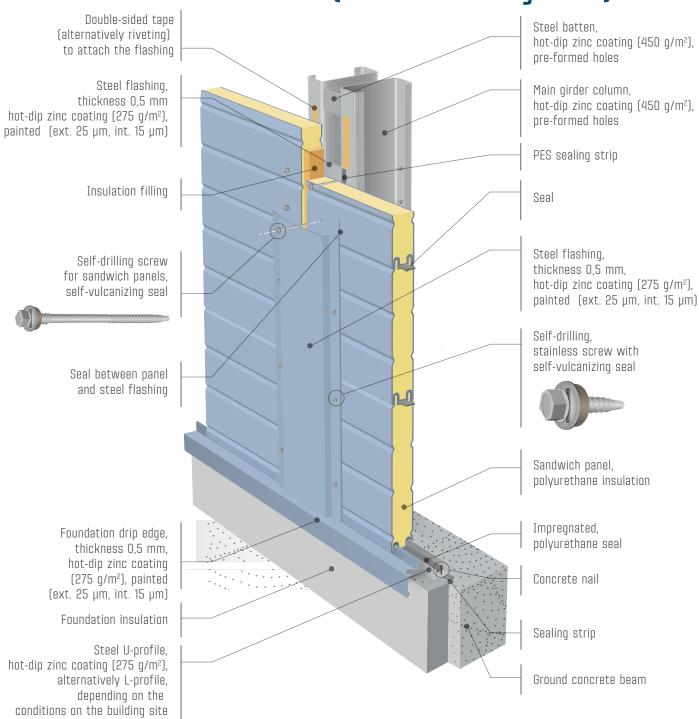

wall insulation - PUR sandwich panels (horizontal arrangement)

PANEL VALUES - IPN/PUR FILLING

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACC 14°C (U _n = 0,32)	cording to Intern. 16°C (U _n = 0,27)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,20)
100	U = 0,22	compliant	compliant	-
120	U = 0,19	compliant	compliant	compliant
150	U = 0,15	compliant	compliant	compliant
200	U = 0,11	compliant	compliant	compliant

Note: Filling - IPN λ = 0,024W/(m.K), ρ = 37 kg/m³.

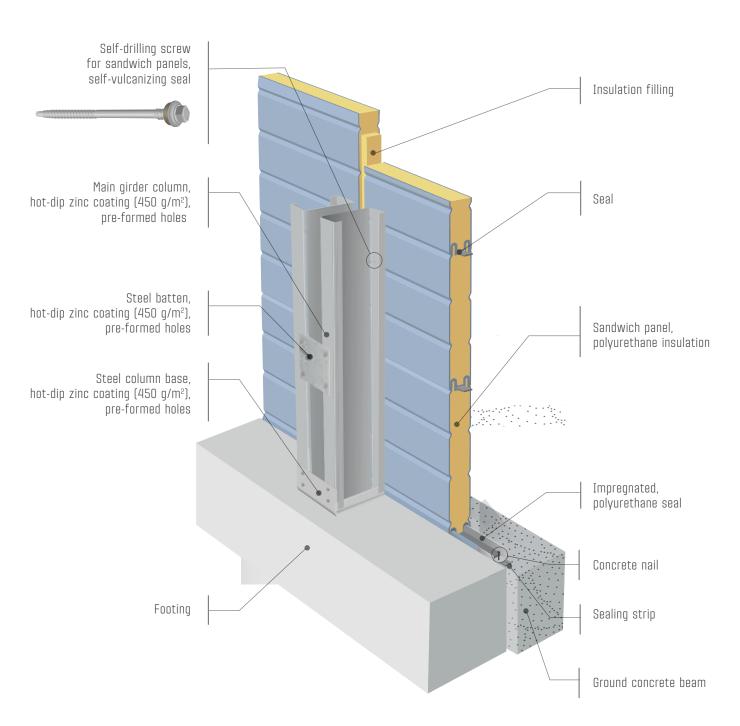

wall insulation - PUR sandwich panels (inner horizontal arrangement)

PANEL VALUES - IPN / PUR FILING

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACC 14°C (U _n = 0,32)	CORDING TO INTERNA 16°C (U _n = 0,27)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,20)
100	U = 0,22	compliant	compliant	-
120	U = 0,19	compliant	compliant	compliant
150	U = 0,15	compliant	compliant	compliant
200	U = 0,11	compliant	compliant	compliant

Note: Filing- IPN λ = 0,024W/(m.K), ρ = 37 kg/m³.

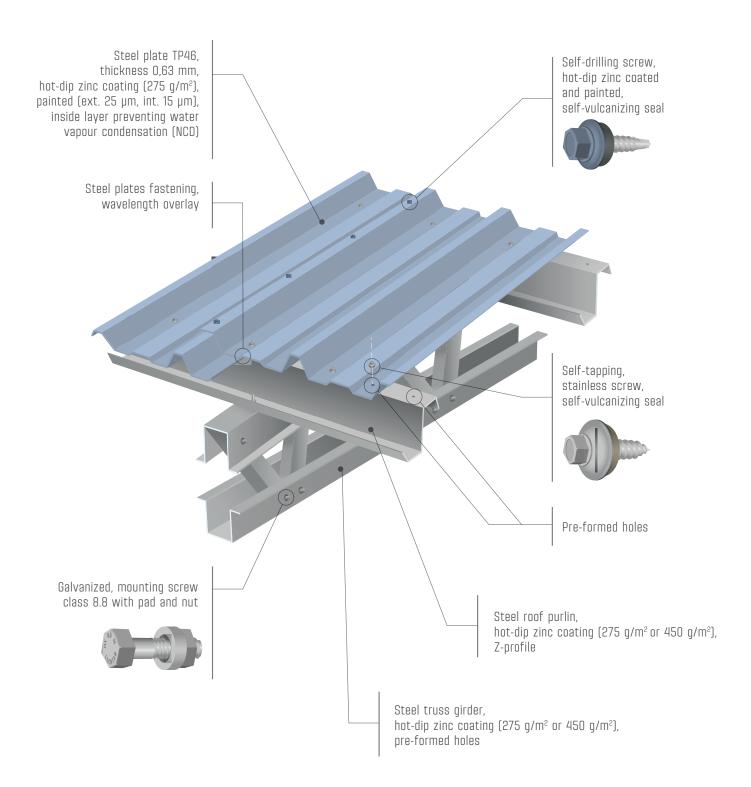

ROOF - TYPE O Uninsulated

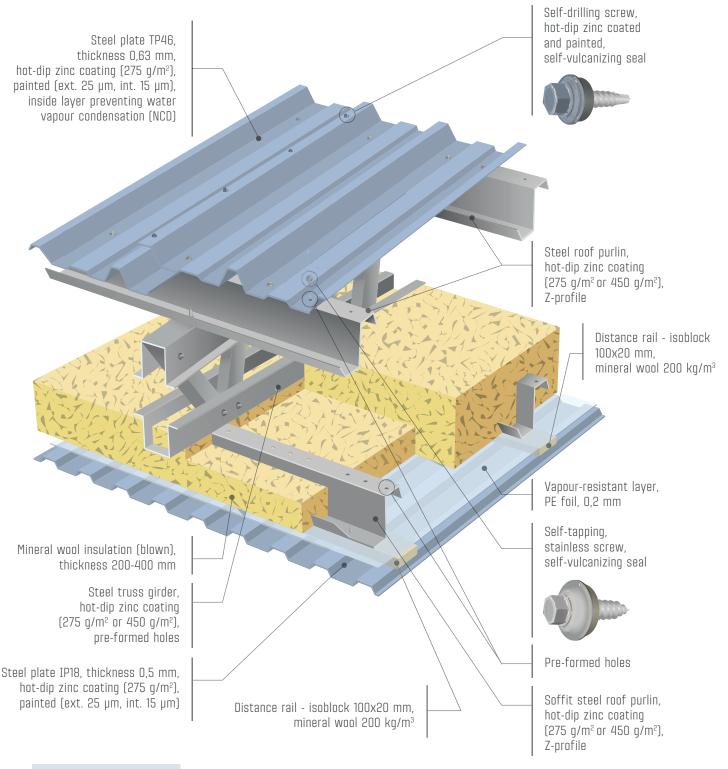

ROOF - TYPE 2LF roof insulation - compound cladding

INSULATION	THERMAL	REQUIRED UN VALUES ACCORDING TO INTERNAL DESIGN TEMPERATUR			
THICKNESS (mm)	TRANSMITTANCE U (W/Km²)	14°C (U _n = 0,26)	16°C (U _n = 0,21)	18°-22°C (U _n = 0,16)	
200	U = 0,19	compliant	compliant	-	
250	U = 0,15	compliant	compliant	compliant	
300	U = 0,13	compliant	compliant	compliant	

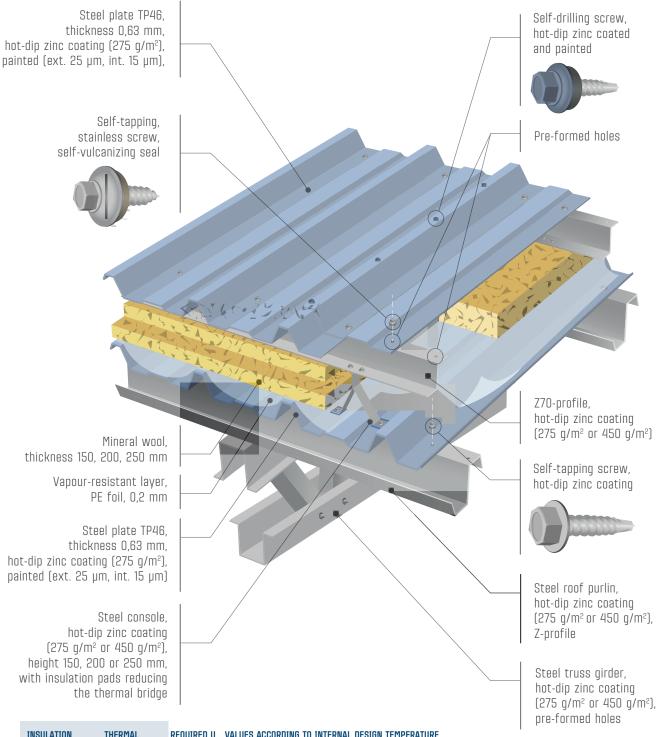

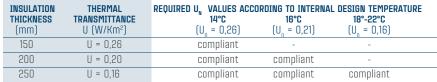

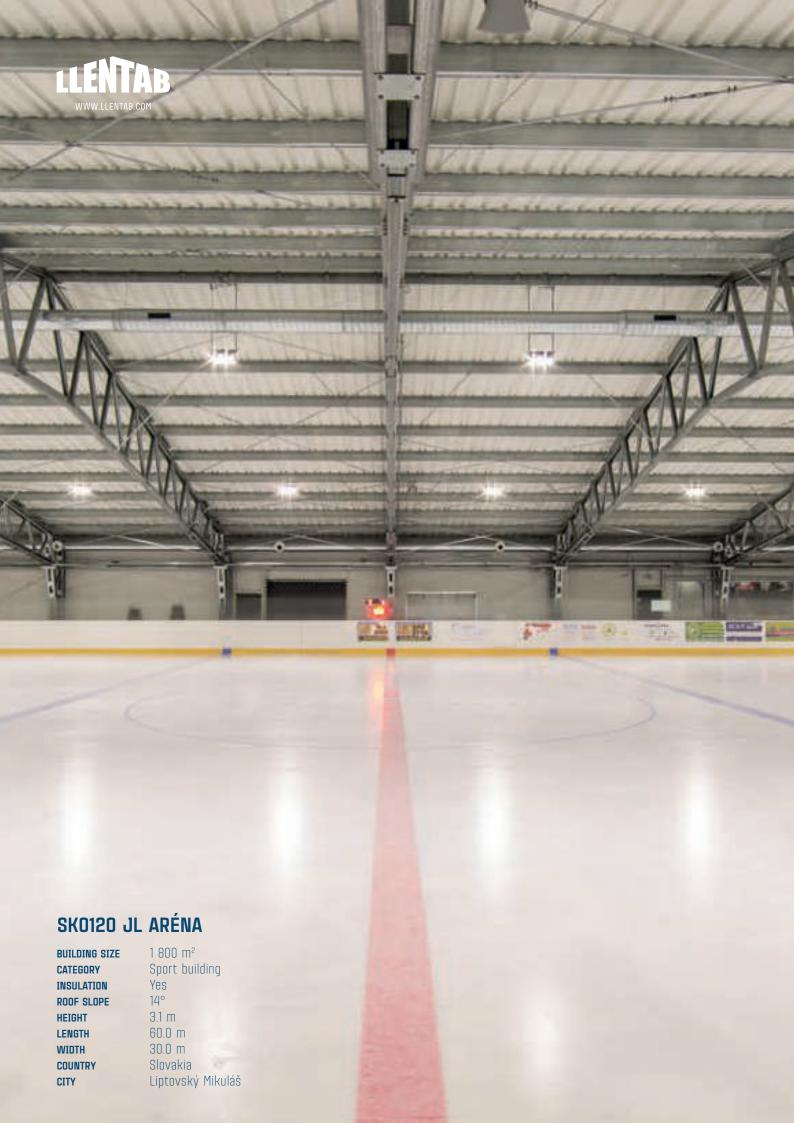

ROOF - TYPE 5 roof insulation - compound cladding

Note: System thermal bridges were taken into account when calculating thermal transmittance. Filling - mineral wool λ = 0,039W/mK, ρ = 50-90 kg/m³.

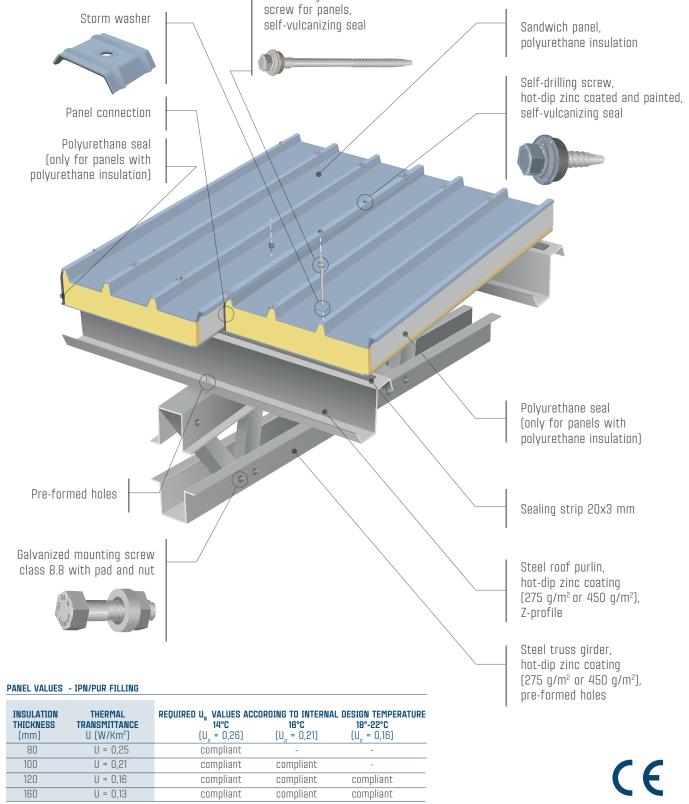

ROOF - TYPE 6 roof insulation - PUR sandwich panels

Self-drilling

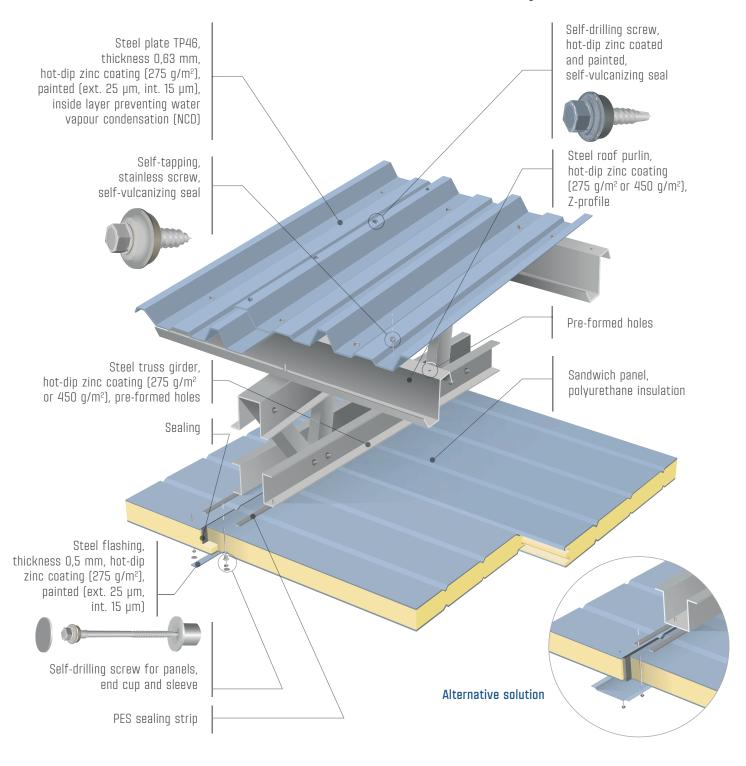

Note: Filling - IPN λ = 0,024W/(m.K), ρ = 37 kg/m³.

ROOF - TYPE 7W roof insulation - PUR sandwich panels

PANEL VALUES - IPN/PUR

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACCO 14°C (U _n = 0,26)	irding to interna 16°C (U _n = 0,21)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,16)
100	U = 0,22	compliant	-	-
120	U = 0,19	compliant	compliant	-
150	U = 0,15	compliant	compliant	compliant
200	U = 0,11	compliant	compliant	compliant

Note: Filling - IPN λ = 0,024W/(m.K), ρ = 37 kg/m³.

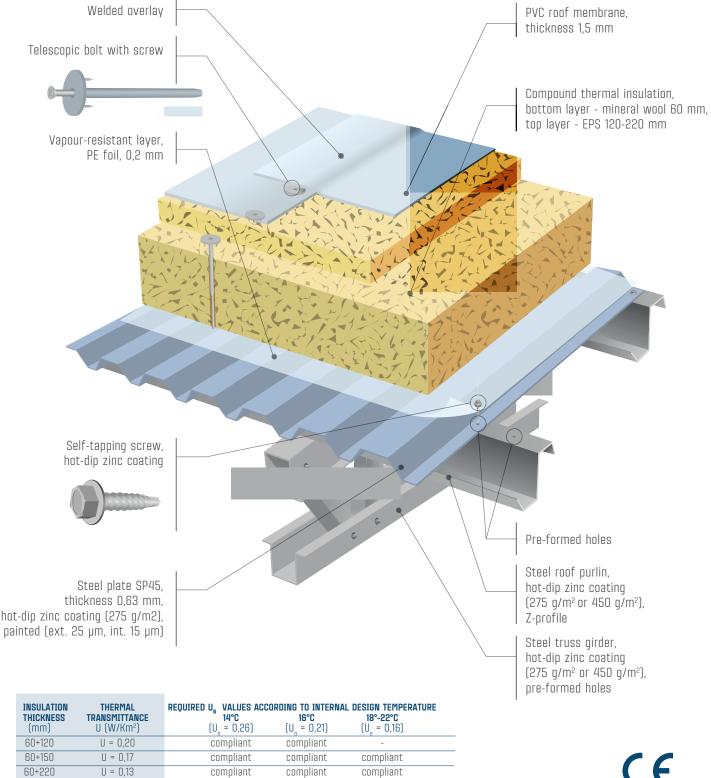

ROOF - TYPE SP roof insulation - compound cladding

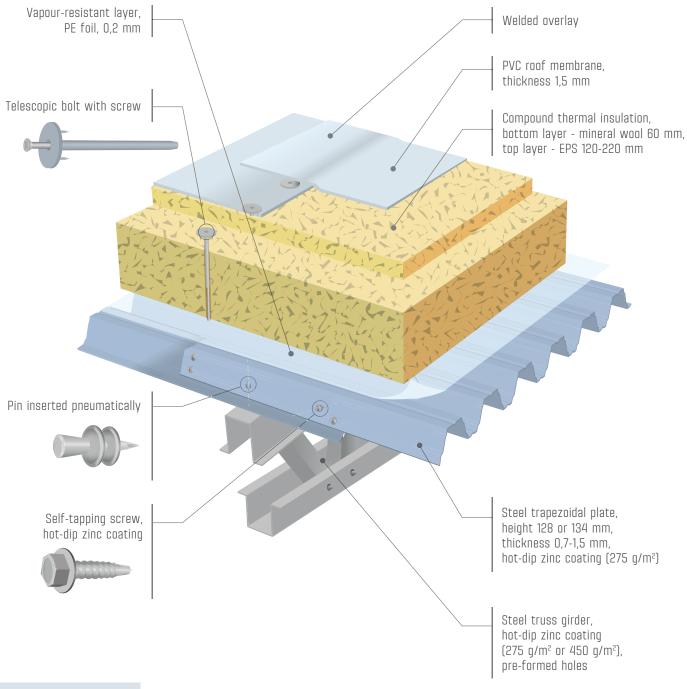

ROOF - TYPE SPH roof insulation - compound cladding

INSULATION THICKNESS (mm)	THERMAL TRANSMITTANCE U (W/Km²)	REQUIRED U _N VALUES ACCO 14°C (U _n = 0,26)	rding to intern. 16°C (U _n = 0,21)	AL DESIGN TEMPERATURE 18°-22°C (U _n = 0,16)
60+120	U = 0,20	compliant	compliant	-
60+150	U = 0,17	compliant	compliant	compliant
60+220	U = 0,13	compliant	compliant	compliant

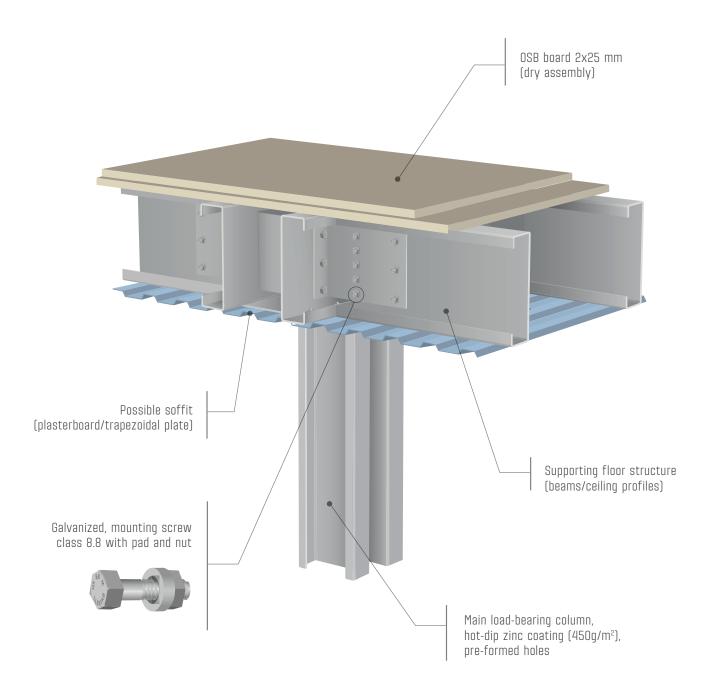

FLOOR - OSB BOARDS dry assembly

The floor consists of a system of ceilings profiles and beams, on which a load-bearing layer of OSB boards is laid. The boards can be laid in one to three layers, depending on the required load and the distance of the ceilings profiles.

LOADING AREAS CATEGORIES	А, В
SPAN	3 - 7 m
PERMISSIBLE LOADING	2,5 - 5,0 kN/m² (depending on the load-bearing capacity of OSB boards)
FLOOR SUPPORTING STRUCTURE THICKNESS	300 - 500 mm incl. beams/ceiling profiles

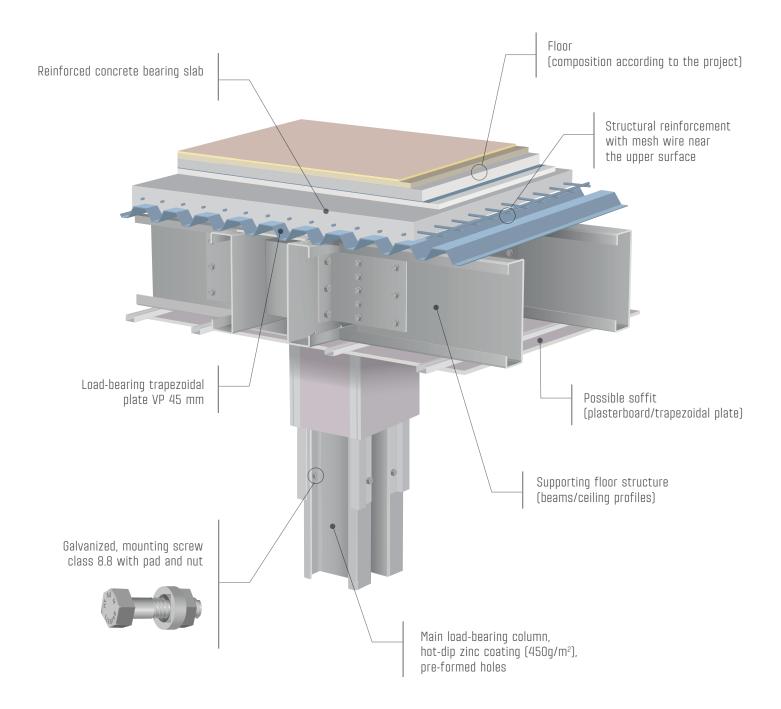

FLOOR - LLENTAB load-bearing trapezoidal plate

The floor consists of a system of ceilings profiles and beams, on which a load-bearing trapezoidal plate is placed. A concrete bearing layer is poured into the trapezoidal plate, which is structurally reinforced with mesh wire near the upper surface. The final composition of the floor is then created on the concrete layer.

LOADING AREAS CATEGORIES	A, B, C1	
SPANS	3 - 7 m	
PERMISSIBLE LOADING	2,5 - 7,0 kN/m²	
FLOOR SUPPORTING STRUCTURE THICKNESS	370 - 650 mm incl. beams/ceiling profiles	

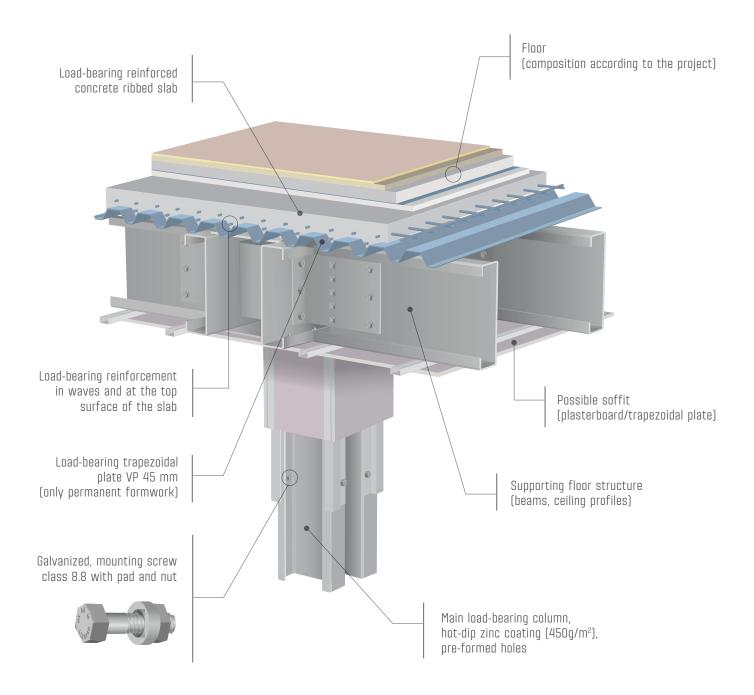

FLOOR - RC SLAB LOW low trapezoidal plate (formwork)

The floor consists of a system of ceiling profiles and beams, on which a load-bearing concrete ribbed slab is poured. The slab is reinforced at the top and bottom surface (in waves). The slab is poured into the permanent formwork made of low trapezoidal metal plate. The final composition of the floor is then created on the concrete slab.

LOADING AREAS CATEGORIES	A, B, C1-C5, D1, E1, F
SPANS	3 - 7 m
PERMISSIBLE LOADING	2,5 - 5,0 kN/m²
FLOOR SUPPORTING STRUCTURE THICKNESS	420 - 650 mm incl. beams/ceiling profiles

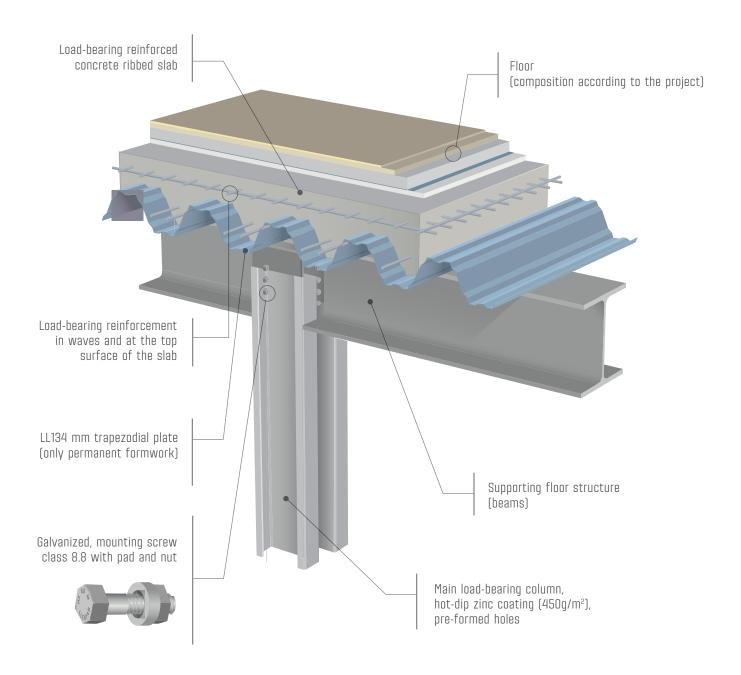

FLOOR - RC SLAB HIGH high trapezoidal plate (formwork)

The floor consists of hot-rolled steel beams in the shape of IPE, HEA or HEB, which are anchored to the columns. A load-bearing reinforced concrete ribbed slab is placed on the beams. The slab is cast into trapezoidal steel plates serving as permanent formwork.

LOADING AREAS CATEGORIES	A, B, C1-C5, D1, E1, F
SPANS	3 - 7 m
PERMISSIBLE LOADING	2,5 - 7,5 kN/m²
FLOOR SUPPORTING STRUCTURE THICKNESS	500 - 600 mm

Note: Fire resistance can be ensured by the structural design of the reinforced concrete slab (reinforcement cover), structural assessment of steel beams, fire-resistant soffit or fire-resistant covering only steel beams or fire-retardant painting of beams only.

Consult LLENTAB technical department for any different uses.

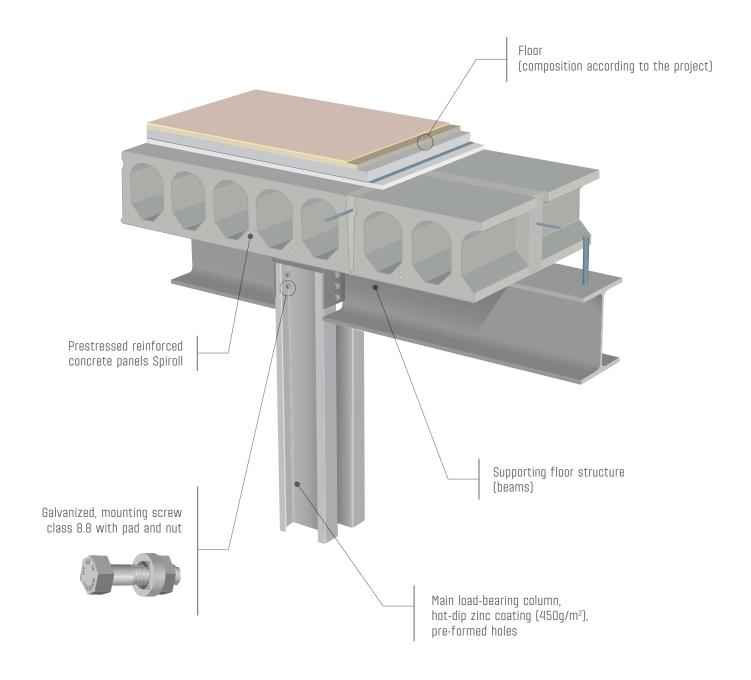

FLOOR - SPIROLL prestressed reinforced concrete panels

The floor consists of hot-rolled steel beams in the shape of IPE, HEA or HEB, which are anchored to the columns. Supporting prestressed reinforced concrete panels SPIROLL are laid on the beams.

LOADING AREAS CATEGORIES	A, B, C1-C5, D1, E, F
SPANS	3 - 12 m
PERMISSIBLE LOADING	2,5 - 10,0 kN/m²
FLOOR SUPPORTING STRUCTURE THICKNESS	160 - 400 mm excl. beams, 410 - 750mm incl. beams

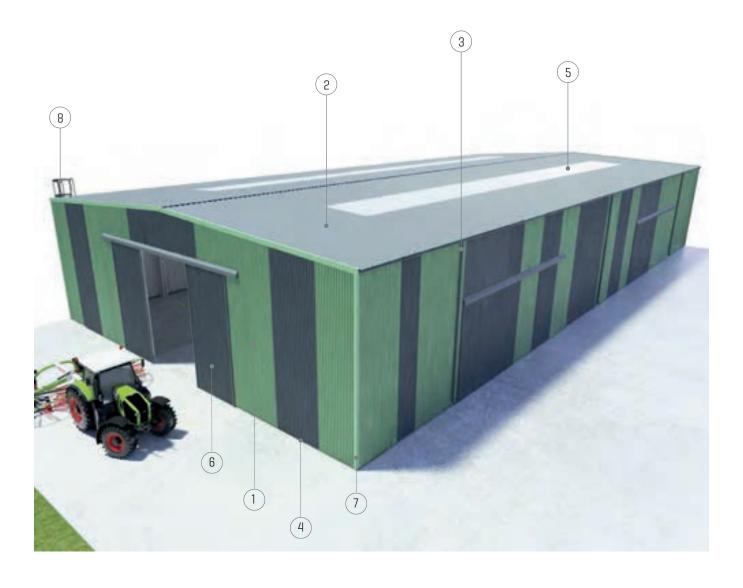

Note: Fire resistance can be ensured by the structural design of the panels, structural assessment of steel beams, fire-resistant soffit or fire-resistant covering only steel beams or fire-retardant painting of beams only.

WALL - TYPE O ROOF - TYPE O

- 1 Steel trapezoidal plate VP45, thickness 0,5 mm, hot-dip zinc coating (275 g/m²), painted (ext. 25 μm, int. 15 μm)
- 2 Steel trapezoidal plate TP46 with NCD, thickness 0,63 mm, hot-dip zinc coating (275 g/m²), painted (ext. 25 µm, int. 15 µm),
